FOR IMMEDIATE RELEASE

February 1, 2008

SRB TECHNOLOGIES (CANADA) INC. has applied to the Canadian Nuclear Safety Commission (CNSC) to amend its licence to allow resumption of tritium processing at the facility.

After the decision of the Commission, in January 2007, not to allow SRB to process tritium, SRB developed a corrective action plan to restore the Commission's faith in our company, to ensure protection of the public, our workers and of the environment, while allowing a return to a viable business operation.

Our plan has been diligently followed and significant improvements to the way the plant was operated up to January 2007 have been implemented. These improvements have been introduced to increase the safety and environmental performance of the facility, and to raise the level of public acceptance.

Improvements include;

- A proposal to operate under a new lower gaseous release limit, which will increase protection of the environment and the public and is even further below the regulatory limit than previously.
- No tritium processing while any type of precipitation occurs.
- The drilling of 27 additional wells at various depths. Monitoring now includes data from a total of 55 wells.
- No operation of the reclamation unit due to concerns expressed by some members of the public.
- Continuing the current Environmental Monitoring Program, with monitoring of 40 air stations, groundwater, local milk and garden produce as well as continued analysis by a third party as requested by members of the public.
- An enhanced public information program which includes more interaction with the public and with special interest groups in particular.

As part of our application we have requested that the Commission extend the expiry of the licence by a period of 24 months from July 31, 2008 to July 31, 2010.

The processing of tritium is key to our ability to continue to provide local employment, to make further improvements to our operation and to support the ongoing provision of decommissioning funds.
